

COLOUR	STATUS BAR ERROR	IMAGE	CAUSE	RESOLUTION
YELLOW	Capture estimated time to overwrite below threshold on 10.0.2.43, drive G - Affected stream(s): Reverse from 10.0.2.42:VVC6 (causing overwrite)	LINK	The drive mentioned is filling up and will soon begin to overwrite.	Clear (all) buffers in the "Capture Status and Control" panel (alt+V)
YELLOW	Unknown captures running on 10.0.2.43 - Affected drive(s): G	LINK	2 different applications writing to the same drive (ChatRecorder and VVC), one of which is not connected to the Viewer showing the error	Free up one application from the drive if possible Manually clear the contents of the drive if not possible.
PURPLE	Error on capture on 16m left (10.0.2.41/10.0.3.41:10437) - Video dropped on input recently (15:29:21) - Cannot obtain context from pool	LINK	Cause #1 : The buffer has recognised some dropped frames, most of the time this is due to a flickering feed or poor network/CPU/GPU performance on the server. Cause #2 : For Offsidelines, a poor calibration or lines not locking in can cause extra usage and lead to drop frames.	Solution #1 : Identify whether decklink input or BNC cable is faulty (check VideoHub) Improve CPU load on server by node balancing or killing/moving software Solution #2 : Check the offside line is looking at the pitch and line tracking can find lines
RED	Cannot connect to PGM Clean on 10.0.2.42 (Streamer2) Cannot connect to PGM Clean on 10.0.3.42 (Streamer2)		You have a feed that is killed that the Viewer is trying to pull into the array. If you are only seeing the cannot connect error for .2 or .3 network, you have probably lost that network	Launch the feed mentioned in the error. Check network connection on the PC, which will most likely be affecting other software.
RED	Cannot overlay image "Overlays/VAR HEI onsite_L.png"		Cause #1 : You don't have any overlay png files in the relevant production folder Cause #2 : Your overlay png files are either not set to 1920 x 1080 pixels or set to a colour depth rate of 32	Solution #1 : Insert the png files you need into the relevant production folder, most of the time this will be VAR_Configuration/XXXXXXXX - These will be given to you by your League. Solution #2: Adjust the pixel size or colour depth to match 1920x1080 / 32 - The overlays will not be compatible otherwise
RED	ChatRecorder on 10.0.2.70 is not connected to GOAL BACKUP	LINK	Viewer cannot see the listed SMARTChat in ChatRecorder	Ensure the listed SMARTChat is launched and connected to the ChatRecorder. If launched, make sure the server containing the SMARTChat has a working .2 network
RED	Close-up camera has dropped frames recently. The network is running slowly (34.2 ms)	LINK	Poor network performance on the server containing the feed mentioned, affecting the transmit of data through to Viewer.	Check network performance of your server (can run NHM between the server and Viewer) to assess the bandwidth running. Check the Network usage in Task Manager and then look into Network Adapter settings or cable performance.
RED	Error deserializing data (FOR EMI)			
RED	Error on capture on Low behind goal left (10.0.2.41:10106) - Video dropped on input recently (15:36:31) - The DeckLink card has dropped a frame, probably due to a glitchy input or high CPU		Cause #1 : Faulty decklink card input, leading to dropped frames Cause #2 : High CPU (usually over 75%), meaning the software can't handle	Solution #1 : Identify whether decklink input or BNC cable is faulty (check VideoHub) Solution #2 : Improve CPU load on server by node balancing or killing/moving software
RED	Ref Mix A has dropped packets recently	LINK	Error with the ingesting of audio into ChatRecorder, either because the smartchat is dropping packets (high performance usage) or because the network connection is unstable	Make sure the server running the SMARTChat doesn't have any performance markers maxing out (CPU/GPU/Memory) and the network connection is stable with the server running ChatRecorder. This can happen occasionally but is a very minor issue as we can afford to drop a few audio packets.
PINK	16 streams have not yet been synced	LINK	Some feeds were not synced during sync process (alt+S)	Complete the sync process with all remaining streams. Note that all streams need to be launched to be available to sync.
PINK	Cannot connect to slave		Cause #1 : You are using a Slave Viewer and it is not launched. Cause #2 : You are using a Backup Viewer and you still have the Main Viewer looking for a Local Slave.	Solution #1 : Launch Slave Viewer Solution #2 : Number of local slaves =1 but it should be 0. If using a UEFA smart file, follow labelling to delete VAR_Main_Viewwer_Local_Slaving on Main Viewer
PINK	Cannot find a delays slaving master for this location on the network	LINK	The backup viewer is looking for a sync master to copy sync values from but can't find one.	Make sure Main Viewer "Stream Settings Slaving" is set as Master, whilst your Backup Viewer is set to Slave.
PINK	Clip Export Location \\10.0.2.70\exports\uefavarclips Inaccessible: The network name does not exist.		UEFA specific issue for which the "uefavarclips" folder in 10.0.2.70\exports either doesn't exist or has not been shared.	Make sure 10.0.2.70 contains a shared "Exports" folder containing a "uefavarclips" folder.
PINK	Failed to send heartbeat to VRControl - Lost connection to the server	LINK	When providing SAO VR, this message appears to say you don't have connection to VRControl on EPTS VR server.	Make sure VRControl is launched on EPTS VR machine.
PINK	Main camera cannot access the time you are trying to view		The videofeed you are trying to access was most likely not recording to disk at the time you have chosen or there isn't a valid connection between the master TSS and the slave TSS.	Make sure you have a Master TSS and a slave TSS with Status OK. Also make sure your stream is recording to disk and you have a solid network connection.
PINK	Output 1 sync error Output 2 sync error	LINK	All your streams have not yet been synced and your SDI Output tiles are therefore not synced either.	This error message will disappear when you have synced all streams available in your Viewer.
PINK	SMARTViewer is not the active window, click anywhere on the window to activate	LINK	You have a program open in front of viewer and it is preventing all viewer commands from taking any effect.	Click / Tap on viewer to keep it as the active window
PINK	Team attacking directions under manual control as data isn't present in player tracking feed	LINK	When providing SAO, this message will show up until a few minutes before kickoff, until the EPTS Op has assigned team directions and numbers. Nothing to worry about.	Nothing to worry about, this will get sorted by the EPTS Op close to kickoff.
PINK	The video server for Low behind right on 10.0.2.44 (VVC20) has too many video segments in its buffer, which can cause redundancy failover to stop working properly	LINK	The buffer has recognised some dropped frames, most of the time this is due to a flickering SSM or poor network performance on the server, leading to the buffer maxing out.	Identify whether decklink input or BNC cable is faulty (check VideoHub) Manually clearing the SSM drive will also temporarily get rid of the error until the buffer maxes out.
PINK	TimeSyncServer on 10.0.2.71 cannot connect to a master TSS		The master TSS is probably not launched and therefore the TSS application mentioned (the one on 71 in this example) has temporarily taken the role of master TSS.	Make sure there is a master TSS on the network and that it's launched.
FAILED ARCHIVE ERROR		IMAGE	CAUSE	RESOLUTION
Audio Sample Size Mismatch - 2088 samples passed in, expecting 2086		LINK	Most likely caused by audio dropped frames on the feed you are trying to archive as packets lost when converting from progressive to interlaced	Make sure the feeds and software format are recording at either i50/p50 or p25, with an input source matching the format. You may need to untick "Convert Progressive to Interlaced" in SDIinput in some scenarios for the format to be correct.
Cannot connect to client			The VVC/Offsideline that we are trying to archive is killed	If not possible or frame mismatch, switch exporting to "Native" Launch the VVC/Offsideline, the archive will start immediately
Cannot modify the FPS for interlaced footage		LINK	The feed you are trying to archive is running at i25 format but the export preset expects at least p25/i50. You could also be dropping frames on an i50 format which would also explain it.	Solution #1 : Get your feed to run at either i50 or p25 (this can also be done by unticking "auto-detect format", selecting 1080p25 as a format and making sure "convert progressive into interlaced" is unticked in SDIinput). Solution #2 : If you are archiving now and the footage can't be changed format, you'll need to set your archiving to Native, and potentially tick "Take Every Frame".
Cannot output audio on a file where the video FPS (25) is > the capture FPS (24)		LINK	The feed you're trying to archive in 25 FPS has dropped below this FPS in the time frame you're trying to use.	If you have an R2, try exporting with this first by killing the R1, as the R2 may not have dropped frames. If not, archive in native format, this will archive whatever FPS it has available to it, duplicating frames when there are gaps.
Data gap threshold exceeded. Reached a gap in the data of 00:00:14.087236 at 2022-10-06 19:56:20.424979			You have a (or several black frame(s) (data gap) in the time frame you're trying to archive. In this scenario, the data gap is exceeding 14 seconds long.	First check if the R2 (if available) contains the same dropped frames. If it does, set the data gap threshold to be 0 (unlimited) in the SMARTViewer.ini and relaunch the Viewer.
ERROR: Ffmpeg error: "Could not open video codec"			If using GPU encoding for archiving but you are using a server that doesn't have a GPU	Make sure the Archiver you are using is on a machine which has a GPU. As an alternative, untick the GPU archiving if possible.
Failed to get audio data, will retry every second			Export clip is expecting audio (most likely from ChatRecorder) but the source is not connected/launched.	Check that ChatRecorder is properly launched and recognised by Viewer.
Repeated frame as data is unavailable. Check exports folder for logs		LINK	The archive is still running but is duplicating certain frames to bridge the gaps. This is due to the fps being lower than the one we want to archive in because it has dropped frames or the format is twice as small as the exporting format.	The archive will work with some duplicated frames. If there are too many frames duplicating, leading in a frozen video, you should look into stabilising the footage to 25/50 fps.
Unable to get video format as all connections were lost			Feeds not recording to disk	Ensure all feeds recording to disk
POP-UP ERROR		IMAGE	CAUSE	RESOLUTION
Error creating archive: Cannot Create \\xxx\xxx\xxx.x" when setting up a new archive		LINK	Cause #1 : The intended export file path is not shared Cause #2 : The intended export file path is not accessible over the network from wherever the archiver is located	Solution #1 : Share the folder you are trying to access (Give Access... to Specific People - R/W everyone) Solution #2 : Ensure all sharing and firewall settings are correct : Windows Defender Firewall disabled Password Protected Sharing turned OFF in Advanced Sharing Settings Network Access Sharing and Security Model for Local Accounts in Guest Mode Only in Local Security Policy
Error sending request to host: WinHttpSenRequest: 12029: A connection with the server could not be established		LINK	When using a blinksticklink production, the connection is not fully recognised and will prompt the error when attempting to use AVAR PTT command.	Make sure the BlinkstickLink application is launched and showing green status bar. Make sure the VAR_BlinkstickLink(_FTT) production is set on Spotter machine. Make sure the httprequests.json is set to look for the correct IP address which is the NUC where AVAR smartchat is located.
